Field of the Invention The invention relates to the diagnosis of orthopedic and other illnesses. More particularly, the invention relates to methods of disease diagnosis and treatment utilizing magnetic resonance imaging. 2. Prior Art In the prior art, a number of techniques have been developed for the diagnosis of orthopedic diseases. It has been established that alterations in the cartilage matrix play a major role in the development of many orthopedic diseases including osteoarthritis. A method for non-invasive measurement of the water content of the cartilage matrix has been developed. The method utilizes the signal decay in T2 weighted magnetic resonance images and the change in relaxation rate (R2) versus T2 is used to measure the water content. See A. A. Goldwasser et al., "T2 Measurements of Tissue Water Content", Radiology, Feb. 1982, Vol. 148, pp. 195-198 and J. F. Everett et al., "Normal Values of Cartilage Water Content by Magnetic Resonance Imaging", Arthritis and Rheumatism, Vol. 27, No. 1, January, 1984, pp. 58-63. The water content measured by this technique has been shown to be closely related to the histological measurements of the matrix water content. Thus, changes in water content are a good indication of the degree of tissue damage, and hence, indicate a disorder in the matrix. Because of the close relationship between the cartilage water content and the degree of tissue damage, it has been suggested that changes in water content can be used to diagnose the onset of orthopedic diseases such as arthritis. See R. A.
