... Wilcom EmbroideryStudio e3 Full PC Import. ream of 500w in pin of leopard pattern and original fabric. Wilcom EmbroideryStudio e3 Full PC Import. Wilcom EmbroideryStudio e3 Full PC Import is a embroidery design software program that helps you produce full-color, full-bleed.Q: How to access the private property of a class from another class? I have a Class A that takes in a public method from another Class B and creates a widget from that method. This works fine. class ClassA { public \$_controller; public function __construct(){ \$this->_controller = new ClassB(\$_POST); } public function widget(){ \$this->_controller->_view(); } } class ClassB{ public \$myvar; public \$_view(){ \$this->myvar = "Hello World" } } Instead of creating a widget with this method, I would like to have a widget that contains ajax call. So I need to access the property of ClassB. ClassA::widget(){ \$this->_controller->myvar = "Hello World"; } This throws me an error. If I make myvar public, I don't get an error but then it is public to the world. I am sure there is a very simple answer but I have been trying to get this to work for half an hour. A: I believe you want the following code... I have removed the \$_controller variable from your code as it was not being used. ClassA::widget(){ \$this->_controller->myvar = "Hello World"; } If you actually need an additional user variable then create one in your constructor ClassA::widget(){ \$this->_controller->myvar = "Hello World"; \$this->_controller->user = "new user value";
